

Take-Home Assignment

MySubscriptions: A Connected Services Dashboard with AI Summarization

Duration: Estimated 4–8 hours Submission Format:
GitHub/GitLab repo + hosted link (preferred)

Objective

Build a small web application called **MySubscriptions**.

This app will allow a user to connect to one or more online services using OAuth2, retrieve recent user data, and present a dashboard with AI-powered summaries or insights for each item. This challenge is designed to evaluate your ability to:

- Integrate with cloud-based services and APIs
- Use OAuth2 securely and effectively
- Apply simple AI/NLP processing (e.g., summarization, keyword extraction)
- Build clear, usable interfaces

Requirements

1. OAuth2 Authentication

Allow the user to sign in via at least **one** OAuth2-compatible service.

Examples:

- GitHub: Repositories, issues, commits
- Google Calendar: Events
- Reddit: Subscriptions and posts
- Spotify: Playlists, tracks
- Pocket, Notion, or similar
- Dropbox, GDrive

2. Fetch & Display Items

Retrieve 10–20 items (e.g., events, posts, bookmarks, issues or files)

Show:

- Service name/logo
- Metadata: title, date, author/source, etc.

3. AI-Powered Processing

For each item, perform at least one:

- **Summarization**
- **Keyword**
- **extraction**
- **Sentiment analysis**

You can use OpenAI, Claude, Cohere, HuggingFace, or open-source libraries like spaCy or transformers.

4. User Dashboard

- Simple, clean UI displaying:
 - Original metadata
 - AI-generated output (summary, tags, sentiment) •
- Optional filters/search

5. Future enhancements

If you were given 1/5/20 more days, what enhancements would you plan?
Please describe – maybe in the Readme.md or separately.

Optional Enhancements

- Support multiple services (e.g., GitHub + Spotify)
- Keyword visualizations (e.g., chart of most common terms)
- Backend API separation
- Allow user to choose processing type (summary, keywords, sentiment)

Submission Instructions

Please provide:

1. Code Repository

- A public GitHub or GitLab link

2. Hosted Version (Preferred)

- Please include a link to a **deployed version** (e.g., Vercel, Netlify, Render, etc.)
- This allows us to test it easily without local setup

3. Documentation (README.md)

- Setup steps (incl. `.env.example`)
- High-level architecture & design
- Brief on your AI/NLP implementation
- Any limitations or next steps
- (Optional) Screenshots or short demo video

Evaluation Criteria

Category	We Look For
Authentication	Secure and working oAuth integration
Category	We Look For

API Integration	Correct and meaningful data retrieval
AI Integration	Effective and insightful NLP use (no need for custom models)
Code Quality	Clean, modular, well-structured code
UI/UX	Intuitive, readable, and responsive layout
Initiative	Bonus ideas or polish that demonstrate creativity

Notes

- You're free to use your preferred stack (TypeScript + React or Next.js encouraged)
- Focus on clarity, functionality, and problem-solving—not polish alone
- If anything is unclear, make reasonable assumptions and note them in the README
- Do as much as you can in the allotted timeframe – you do not have to complete everything

Good luck and thank you for your time and interest!
